

Sorted neurons excel table

Find/create the Sorted neurons excel table corresponding to your monkey in the following location:
C:\Users\username\Dropbox\DAG\phys\Monkey_phys_dpz\Mon_sorted_neurons.xlsx (replace username with your username, Monkey with the monkey's name and Mon with the first three letters of the monkey's name).

There are two main sheets in this excel file:

- automatic_sorting
- final_sorting

The idea is, that a large part of the information can be updated automatically (**see...**), while some information has to be added manually in the final_sorting sheet. For both sheets, each line represents one unit recorded in one block (and run) AND/OR the corresponding LFP site

Automatically created entries

Monkey	Session	Date	Run	Block	Chan	z	Unit	N_spk	Neuron_ID	Site_ID	Times_same_unit
Lin	1	2010508	3	1	1	15000	a	15251	Lin_20150508_01	Lin_20150508_Site_01	1
Lin	1	2010508	4	2	1	15000	a	15251	Lin_20150508_01	Lin_20150508_Site_01	1

- Monkey: monkey initials (first 3 letters)
- Session: A session counter (irrelevant, but helpful for browsing)
- Date: Date of recording
- Run: Corresponding behavioral run
- Block: ephys recording block
- Chan: electrode number (channel)
- z: Electrode depth (from guide tube tip) - taken from [electrode depth file](#)
- Unit: sortcode assigned to this cell (a=first,b=second,...)
- N_spk: Total spike count
- Neuron_ID: Cell identifier (the [same cell](#) can be recorded in several blocks !)
- Site_ID: LFP site identifier (Based on electrode depth, same site can be recorded in different blocks and at the same time with different units)
- Times_same_unit: For identifying unique units

Manually added entries

SNR_rank	Single_rank	Stability_rank	Set	Target	Hemisphere	Grid	x	y
1	1	2	1	dPul	left	22.5	-5	8
1	2	1	1	dPul	left	22.5	-5	8

The first three entries should be taken from your notes during sorting. For internal ranking conventions see ???

- SNR_rank: Signal to noise ratio assessment
- Single_rank: Multiunit or single unit
- Stability_rank: How stable were the features across time

The other entries typically don't change within a session and can be taken from the log file

- Set: Dataset, relevant for assigning to specific project (**see ...**)
- Target: Area
- Hemisphere: left/right
- Grid: grid identifier (diameter.number)
- x: grid hole coordinate x
- y: grid hole coordinate y

Electrode travel

Last, but not least, there is another entry which is typically calculated inside the table using different approaches per experimenter: Electrode_travel. Several columns serve the purpose of calculating the electrode travel (from top of the grid).

Other entries ???

Difficult_sorting_or_unstable	Other_potential_reasons_to_ignore_or_check	Runcomplete	Usable	Comments
-------------------------------	--------------------------------------------	-------------	--------	----------
